

Pharma-Grade Biosecurity Built Into Malta's Modular Cannabis Facility

A modular indoor facility is integrating ProGuard into every room and corridor to support clean-room discipline, strict microbial testing and efficient future expansion.

20+ units installed in Grow rooms, Dry Rooms, and Post-Harvest rooms.

“ProGuard gives us that peace of mind when it comes to air sanitation.”

KEARNEY ATTARD | CANNABIS.MT

THE CHALLENGE

The Malta project is being built to medical-cannabis standards even where local rules may not demand that level of precision. Strict testing, post-harvest contamination risk and the need to expand without expensive redesigns all shaped the facility strategy.

THE PROGUARD APPROACH

The modular design allows rooms, utilities and cultivation systems to be upgraded independently. ProGuard is planned for every room and corridor as an additional biosecurity layer supporting the facility's sanitation procedures, data controls and pharma-grade operating standards.

DESIGNED OPERATING BENEFITS

Benefits the project is building into its operating model

- ✓ **Lower microbial risk**
Continuous room and corridor coverage is intended to reduce pathogen pressure across cultivation and post-harvest movement areas.
- ✓ **GACP and EU GMP readiness**
Clean-room air practices support the stringent microbial expectations of European medical markets.
- ✓ **Efficient modular expansion**
Independent rooms and standardized systems allow growth without disrupting the entire operation.
- ✓ **Quality and yield protection**
Prevention helps protect valuable flower before contamination can create rejected product, remediation or crop loss.

Design microbial control into every room, corridor and future expansion phase.

PHARMA-GRADE AIR SANITIZATION FOR EUROPEAN COMPLIANCE
